SKILLS

Specialisations

Governance & approval UX
Hierarchy & data visualisation
Design systems & governance
Information architecture
Operational workflow design
Zero-to-one product thinking

Practice

End-to-end product design
Stakeholder research & interviews
Design-to-dev traceability
WCAG / accessibility standards

AI & Tools

AI-native product design
Figma · Figma AI
Claude · Lovable · Vercel v0

DOMAINS

CRM & customer data
Sales & revenue operations
Data governance & stewardship
Enterprise design systems

EDUCATION

B.Tech — Computer Science

Chandigarh University, Mohali
2021 – 2025

BEYOND WORK

Portrait sketching & painting

Product designer for enterprise data platforms. Replaced 50+ fragmented spreadsheets with one governed CRM hierarchy platform now serving 1000+ users, and shipped two AI-native internal tools alongside it — inside a US-headquartered enterprise client's global CRM and customer-data program. Computer-science background, which shows up as precise design-to-dev handoffs and fluency in implementation tradeoffs.

EXPERIENCE

UI/UX Designer

May 2025 – Present

Copan Consultancy Services Pvt. Ltd.

Client engagement: US-headquartered enterprise client — global CRM / customer-data program

Unified Customer Definition — zero-to-one CRM hierarchy platform

- Led end-to-end design for the platform that replaced 50+ fragmented spreadsheets with a single governed customer hierarchy — hierarchy visualisation, structural modification workflows, a governance engine, and an AI-assisted operations layer — now serving 1000+ users.
- Framed the customer model as four nested layers — account, division, corporate umbrella, and a single top-level customer view — after 40+ stakeholder interviews across three regions found the same customer carrying a different name, tier, and owner in every source system. Mapped the model against a 35,000-node sales hierarchy.
- Designed the steward review-and-disposition workflow, the platform's daily-use surface, against an inbound queue of 1,500+ unresolved records a day.

CR Control Tower — operational data-health dashboard

- Pushed for an actionable dashboard; the business required visibility first. Shipped Phase 1 as visibility across 15 consolidated source systems and 8,000+ flagged records, with actionability scoped and documented for Phase 2 rather than half-building both.
- Designed against the data model that should exist while engineering built the pipelines that could exist, reconciling the two across two months of weekly syncs — so design was never blocked on an incomplete backend.

Experience Unification — 11 product verticals

- Ran the experience audit across all 11 verticals and authored the design-system governance framework covering component intake, review, and deprecation.
- Built an experience-maturity scoring model so vertical prioritisation ran on comparable data rather than subjective judgement, and placed each vertical on a three-tier map — current, harmonised, north star — with no tier skipped.

AI-native internal tooling

- Designed and shipped **UX Audit AI**, a one-click heuristic and WCAG pass that cut my own pre-review sweep on each screen from a manual checklist to a single automated pass before manager and client review.
- Co-designed **Design Analyst Guide**, an AI workflow converting unstructured stakeholder input into structured PRDs, epics, and user stories.

Cross-functional delivery

- Wrote user stories and ran sprint handoffs with engineering across four live platforms; a computer-science background meant implementation tradeoffs were negotiated in a shared vocabulary rather than translated.
